

Everyone loves a quick turnaround.

Let our SteriPro experts show you how parametric release can shorten your processing time by days or even weeks. We'll help you get your products to market faster, while meeting all necessary sterilisation standards — guaranteed.

If you're interested in securing quicker release for your products (and who isn't?), we've got good news for you. Sterigenics will be installing microwave spectrometers at all of our European facilities this year, which will allow us to offer parametric release.

That means we can release your products immediately after aeration — while still meeting all required standards for sterilisation. No more waiting around on time-consuming Biological Indicators. Parametric release can remove as much as 21 days from your processing time.

Find out more about how our SteriPro programme of cycle optimisation can reduce your work in progress, and help you get your product to market faster — without tying up your staff in paperwork.

Call your local Sterigenics facility for more information or email us at info@iba-sni.com.
